About Cochlear

© Cochlear Limited 2026

The story that started it all…

It was his deaf father's struggles that ignited this determination.

Professor Clark grew up seeing the hardship of living in silence – including the frustration, anguish, and resulting isolation. He also witnessed his father's desire for a greater connection to others and was determined to make it possible.

Cochlear was founded in 1978 when the first multi-channel cochlear implant was implanted. Since then, there has been a commitment to **innovation, quality**, and **recipients.**

Cochlear®

Defining the Need

Hearing loss is prevalent and under-treated

1 in 3

Nearly 1 out of every 3 people over the age of 65 is affected by hearing loss.[1] It affects communication and can contribute to overall health and wellness.[2]

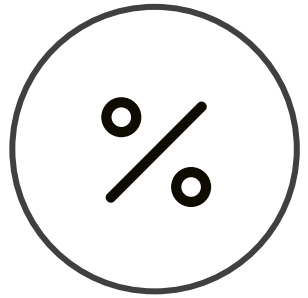

>328 million

Suffer from Chronic Otitis Media, which is more than half of the global burden of hearing loss.[3]

>15 million

People could benefit from a cochlear implant to treat severe to profound hearing loss across children globally and seniors in the developed world.[4]

3% & 5%

Patients accessing who are candidates for acoustic and cochlear implants.[4]

Cochlear®

Types of Hearing Loss

© Cochlear Limited 2021

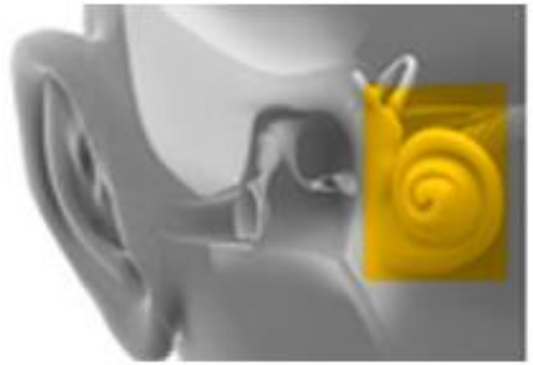

Types of Hearing Loss

Depending on which part of the ear is damaged, hearing loss can be classified as one of four different types:

SENSORINEURAL

SINGLE-SIDED DEAFNESS

CONDUCTIVE

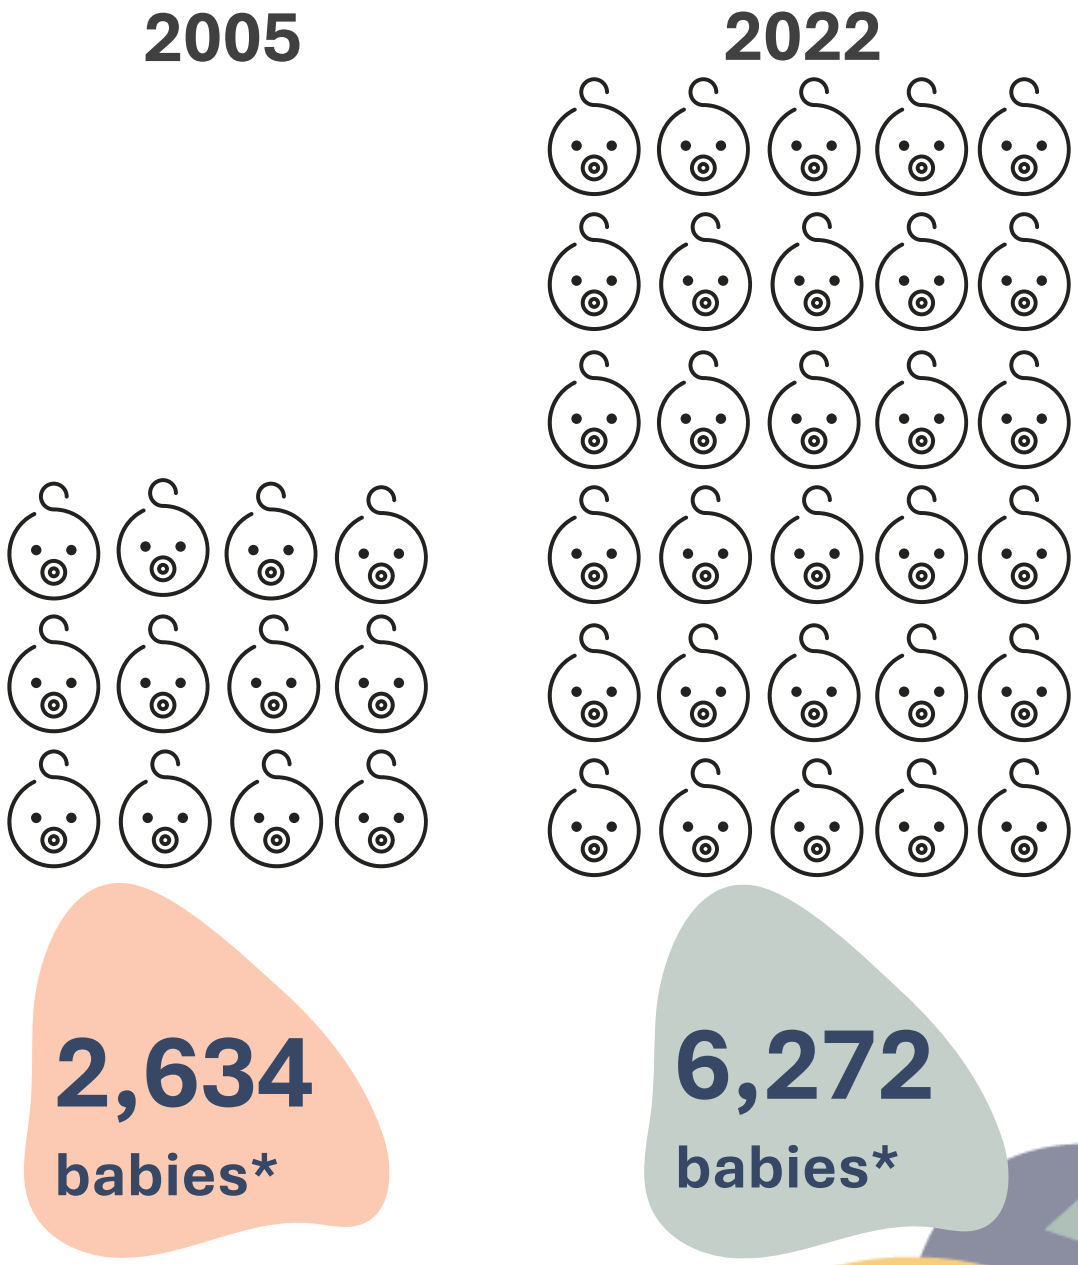

MIXED

Cochlear®

Candidacy

More and more babies who are born deaf or hard of hearing are being identified early in the United States

https://www.cdc.gov/ncbddd/hearingloss/ehdi-data.html

*Symbols not to scale.

Early Access to Sound: Clinical Study Results

Cochlear®

Children with cochlear implants can:

Develop spoken language early

Children develop better spoken language if they receive their cochlear implants as early as possible[1,2]

Achieve outcomes on par with typical-hearing peers

Acting early can support speech and language development similar to, or consistent with, their hearing peers[3]

Establish better language skills

Children implanted prior to 12 months of age can develop better language skills than those who are implanted later[3,4]

Up to

80%

of children who received cochlear implants younger than 12 months demonstrated **receptive vocabulary knowledge within the normal range** by school entry.[1]

2. Ching TYC, and Dillon H. (2013) Major findings of the LOCHI study on children at 3 years of age and implications for audiological management. Int J Audiol, 52(Supp2)
3. Ching TYC et al (2017) Age at intervention for permanent hearing loss and 5-year language outcomes. Pediatrics; 140(3).
4. Dettman et al. (2016) Long-term communication outcomes for children receiving cochlear implants younger than 12 months: A multicenter study. Otol Neurotol; 37(5).

Expanding Pediatric Access

Health Economics and Policy Change

Working with major private insurance companies and state Medicaid medical directors to educate them on the new indications and rationale for coverage

Partnership with Industry Groups

Working with AAA, ASHA and ACIA to educate the community at large on the new indications

Grass Roots Awareness

Cochlear will be participating in awareness at a grass roots level, as well as social media promotion and local news stories

Support for Families

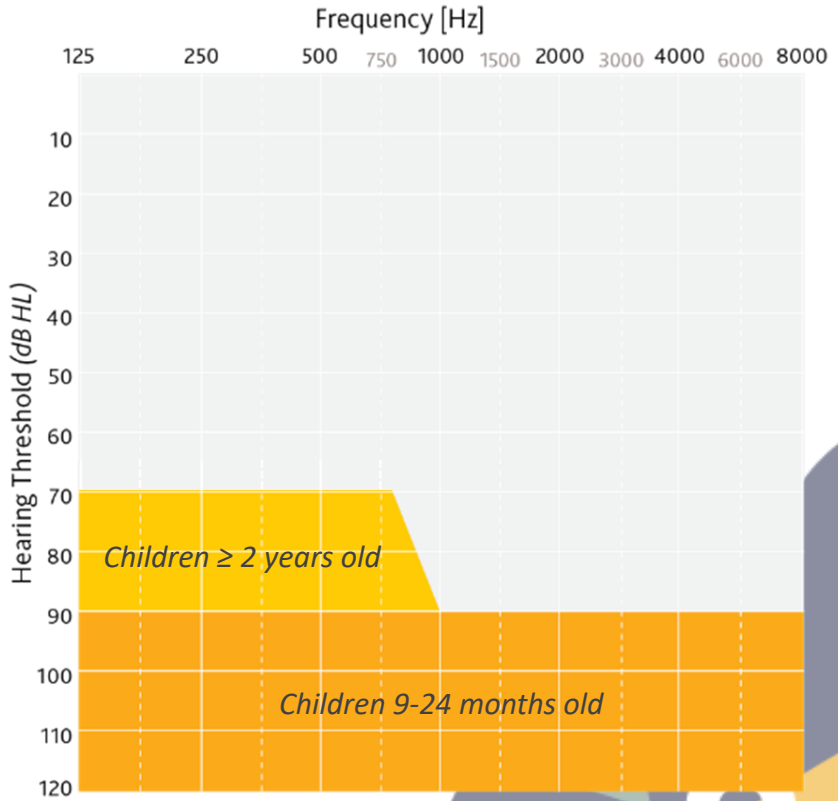

Through collaborating with non-profits AG Bell's Cradle to Career Program.

*In the United States, the Cochlear Nucleus Implant System is approved for use in children 9 to 24 months of age who have profound sensorineural hearing loss in both ears and demonstrate limited benefit from appropriate hearing aids. Children 2 years of age or older may demonstrate severe to profound hearing loss in both ears. In younger children, limited benefit is defined as lack of progress in the development of simple auditory skills in conjunction with appropriate amplification and participation in intensive aural habilitation over a three-to-six-month period. It is recommended that limited benefit be quantified on a measure such as the Meaningful Auditory Integration Scale or the Early Speech Perception test. In older children, limited benefit is defined as ≤ 30% correct on the open set Multisyllabic Lexical Neighborhood Test (MLNT) or Lexical Neighborhood Test (LNT), depending upon the child's cognitive and linguistic skills. A three-to-six-month hearing aid trial is recommended for children without previous aided experience.

Pediatric Indication: Cochlear Nucleus Cochlear Implant

Cochlear Nucleus Cochlear Implants are intended for use in children 9-24 months of age who have bilateral profound sensorineural deafness and children two years of age or older who have severe to profound hearing loss bilaterally who demonstrate limited benefit from hearing aids.^*

- ✓Young Children: lack of progress in the development of simple auditory skills when appropriately aided
- ✓Older Children: ≤30% correct on open set word recognition tests

*To reduce the risk of anesthetic-related adverse events, a pediatric anesthesiologist should be present during surgery for infants implanted under 12 months of age

^In Canada, the CI600 Series cochlear implant is intended for use in children 9 to 24 months of age who have profound sensorineural hearing loss in both ears and demonstrate limited benefit from appropriate hearing aids. Children two years of age or older may demonstrate severe to profound hearing loss in both ears.

When to Consider a Cochlear Implant Evaluation: Infants* and Toddlers

- ❑ Does not react to loud sounds
- ❑ Does not seek out or detect where sound is coming from
- ❑ Has stopped babbling and experimenting with making sounds
- ❑ Still babbles but is not progressing to more understandable speech
- ❑ No reaction to voices, especially when being held

*The Cochlear™ Nucleus® Cochlear Implant System is intended for use in children 9-24 months of age who have bilateral profound sensorineural deafness and demonstrate limited benefit from appropriate binaural hearing aids. Children two years of age or older may demonstrate severe to profound hearing loss bilaterally.

When to Consider a Cochlear Implant Evaluation: School-Age Children

- ❑ Repeatedly misses or does not respond to all Ling 6 sounds with appropriately fit hearing technology
- ❑ Demonstrates increased dependency on remote microphone technology (FM systems) or visual cues for access to speech in quiet environments
- ❑ Demonstrates slow auditory progress in comparison to typical hearing peers
- ❑ Easily frustrated or experiences communication breakdowns
- ❑ Exhausted at the end of the school day due to constant concentration just to understand speech

UHL/ SSD CI Indication: 5 years and older

- **Ear to be implanted:**
  - ❑ Severe to profound sensorineural hearing loss defined as: Pure-tone average at .5, 1, 2, 4 kHz >80 dB HL
  - ❑ Aided CNC word score or developmentally appropriate word test ≤ 5%

- **Contralateral Ear:**
  - ❑ Normal or near normal hearing defined as: Pure-tone average at .5, 1, 2, 4 kHz ≤30 dB HL

- It's recommended prior to CI surgery that individuals with SSD have at least 2 weeks to 1 month experience wearing appropriately fit CROS hearing aid or other suitable hearing device

Contraindications

A Cochlear Nucleus cochlear implant is not suitable for individuals with the following conditions:

- Absence of cochlea development
- Absence of a cochlear nerve
- Active middle ear infections
- Tympanic membrane perforation in the presence of active middle ear disease

For individuals with single sided deafness the following contraindications are also applicable:

- Duration of profound sensorineural hearing loss greater than ten years

Cochlear

The Cochlear™ Nucleus® Nexa™ System

Hearing with Two Ears

Binaural hearing = hearing with two ears

Hearing with two ears can give you better understanding in noise, speech recognition and sound localization.[3]

Bimodal hearing = hearing implant + hearing aid

- Often effective if you have some hearing in the non implanted ear
- Cochlear implants work with any compatible hearing aid* to give you the benefits of bimodal hearing
- Cochlear and ReSound have partnered to offer Smart Bimodal Hearing that provides the benefit of wirelessly streaming sound into both ears at the same time

Bilateral hearing = two hearing implants

- The ability to hear sound with both ears gives the effect of dimensional hearing. Hearing sounds in both ears is important to provide your brain with enough stimulation to understand conversations and communicate effectively.

* For compatibility information and devices visit: cochlear.com/compatibility and resound.com/compatibility

Cochlear Implants

- Cochlear implants may help those with **moderate to profound** hearing loss in one or both ears who are not receiving enough benefit when using hearing aids
- Consists of two parts – internal implant and external sound processor

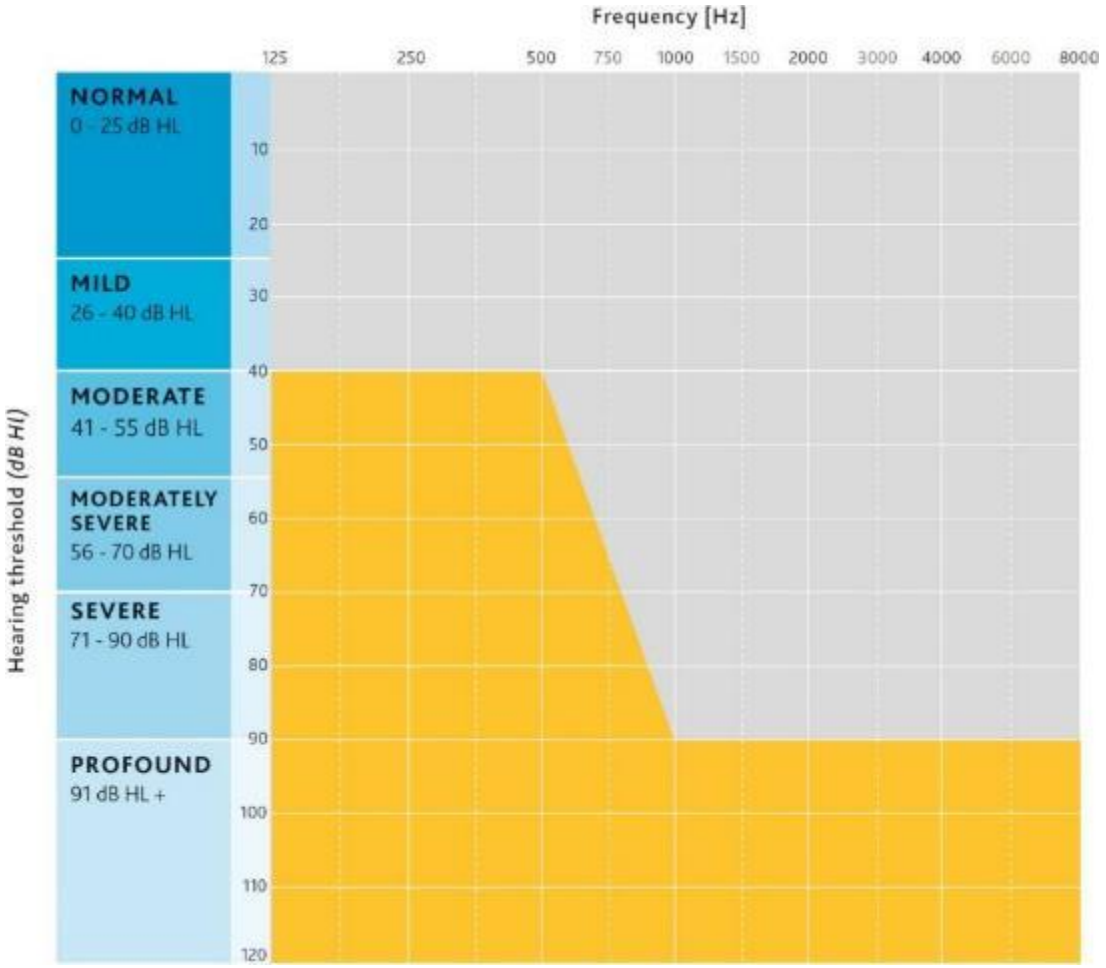

Cochlear™ Nucleus® Nexa™ Implant

Cochlear™ Nucleus® 8 Nexa™ Sound Processor

Cochlear™ Nucleus® Kanso® 3 Nexa™ Sound Processor

Indications represented in chart are for adults 18 and older.

How the Cochlear Nucleus System Works

Video depicting Cochlear Nucleus 7 Sound Processor

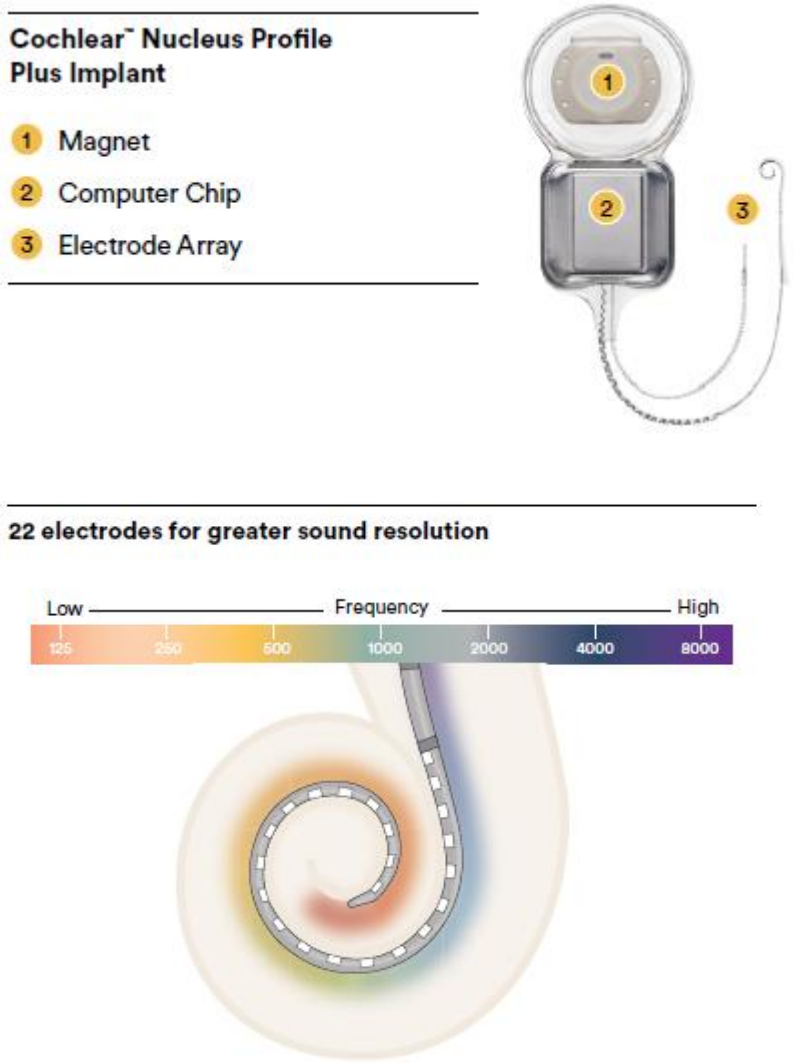

Internal Implant

The internal implant is the component of the system that sits **underneath the skin** that sends signals to the cochlea where they are translated as sound. There are options to match your unique hearing needs.

Your **surgeon makes a recommendation** based on patient factors and preference.

The electrodes on the implant are designed to bypass the damaged sensory hair cells and stimulate the hearing nerve directly to provide the full spectrum of sound. The more active contacts and channels in the cochlea, the more you have access to a **richer hearing experience.**

Lazard et al (2012) demonstrated more active contacts resulted in better speech outcomes.

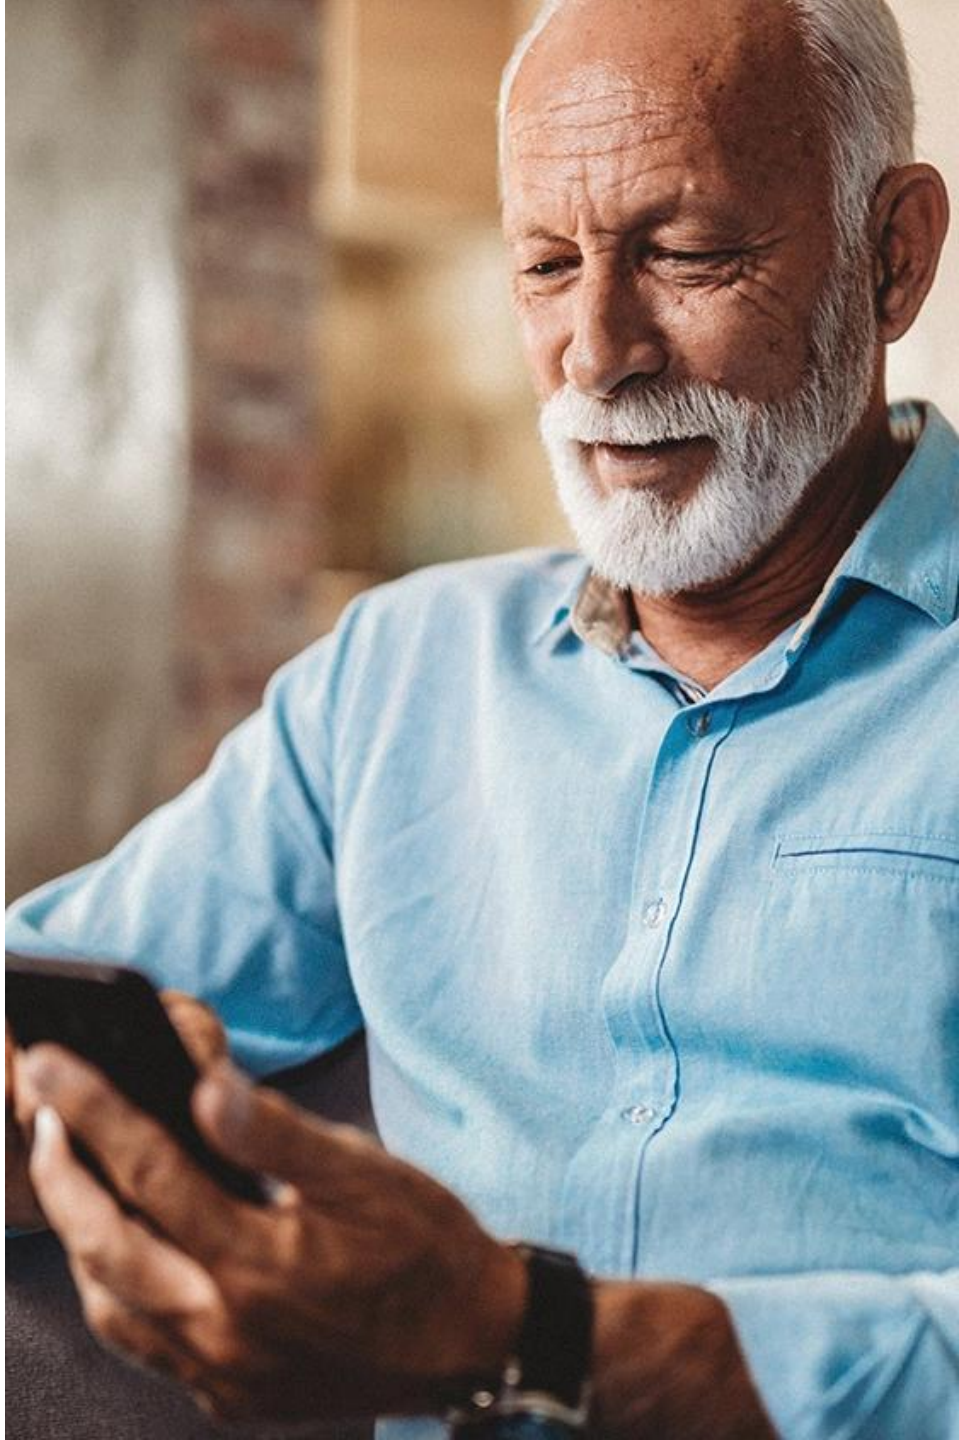

Implant Reliability

When choosing a cochlear implant, you want to trust that you are choosing the best hearing solution for today and for the future.

Why is implant reliability important?

- Provides confidence in your long-term hearing experience
- Peace of mind that your implant will work for years to come
- Cochlear's implants are designed to allow access to future innovation without the need for additional surgery. With the Nucleus Nexa Implant, the world’s first and only smart cochlear implant*^, you will be ready to access future innovation through upgradeable implant firmware. You can also benefit from sound processor upgrades as they become available.

*The only cochlear implant having onboard memory with upgradeable firmware.
^As future advancements or technology become available for the CI1000 series implant, a firmware update may be required in order to take advantage of newer features.

Two main goals for an electrode

Connect

- More efficient and precise stimulation[1-4]
- More sound detail[5-10]
- Excellent spiral ganglion coverage[11]

Protect

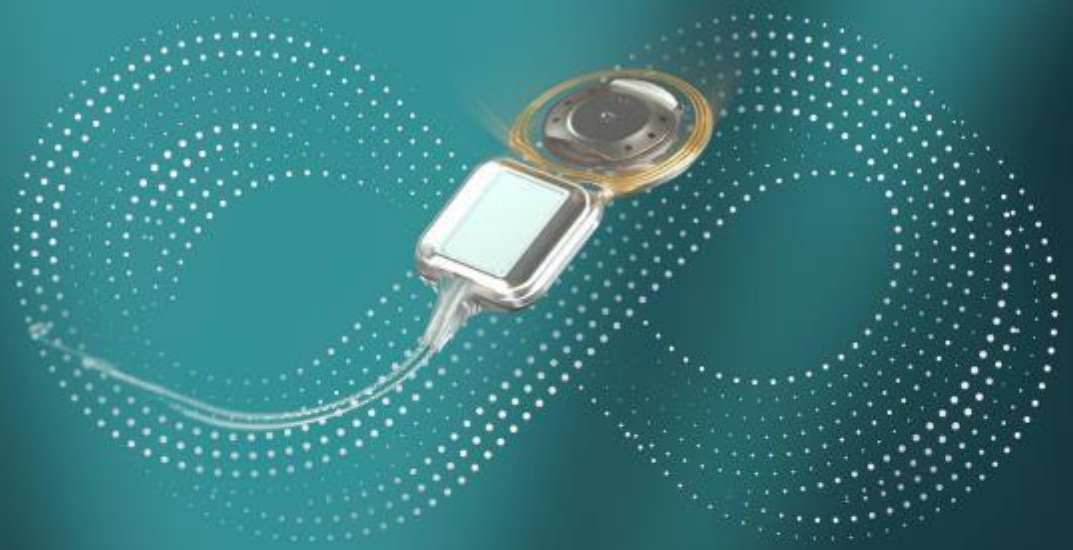

- Atraumatic insertion[12-13]
- Hearing preservation[14-17]
- Avoids damage due to deeper insertion[18,19]

Slim Modiolar is the only electrode that best meets both goals

Cochlear™ Nucleus® Nexa™ System

The future of hearing. Delivered today

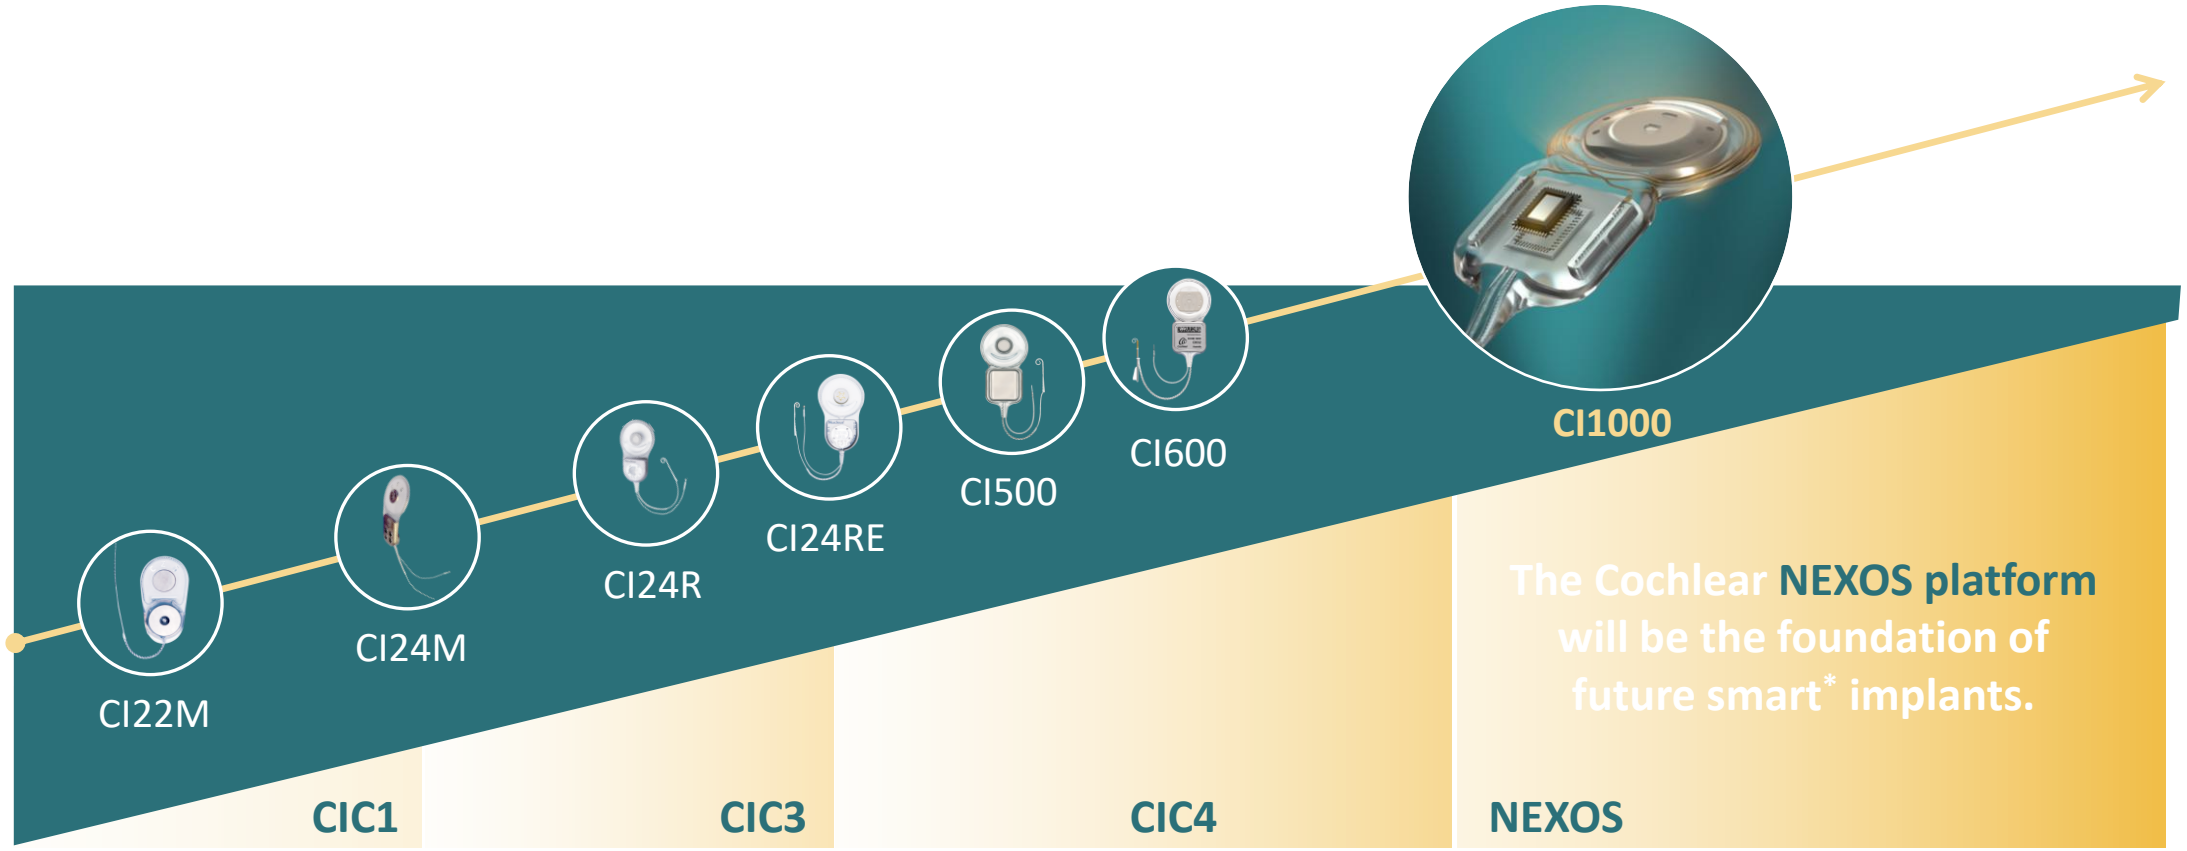

Introducing the world's first smart cochlear implant system*^

*The only cochlear implant having onboard memory with upgradeable firmware.
^As future advancements or technology become available for the CI1000 series implant, a firmware update may be required in order to take advantage of newer features.

What is upgradeable firmware?

Nexa upgradeable firmware* is **rewritable**, allowing the implant to be ***updated or reconfigured*** to enhance features and performance—*without replacing the implant*.

Traditional cochlear implants add features and improve performance exclusively through sound processor technology.

**As future advancements or technology become available for the CI1000 series implant, a firmware update may be required in order to take advantage of newer features.*

Accessory Options to Fit Your Lifestyle

Soak, Splash & Swim

Several of our sound processors have the optional Aqua+ accessory which allows you to enjoy swimming, surfing, snorkeling and more

- Can be submerged up to 10 feet for 2 hours*

Nucleus 8 with Compact Aqua+

Nucleus Kanso 2 with Aqua+

Aqua+ for Osia**

*The Cochlear Nucleus 8 Sound Processor is dust and water resistant to level IP68 of the International Standard IEC60529. The Nucleus 8 Sound Processor was tested to a depth of up to 1 meter for up to 1 hour. The Nucleus 8 Sound Processor with Aqua+ is dust and water resistant to level of IP68 of the International Standard IEC60529 when you use a Cochlear Power Extend Rechargeable Battery Module or Cochlear Compact Rechargeable Battery Module. The Nucleus 8 Sound Processor with Aqua+ can be continuously submerged under water to a depth of up to 3 meters for up to 2 hours. The Aqua+ accessory should be used when participating in prolonged water activities. Refer to the relevant user guide for more information.
The Kanso 2 Sound Processor is dust and water resistant to level of IP68 of the International Standard IEC60529. The Kanso 2 Sound Processor with Aqua+ is dust and water resistant to level of IP68 of the International Standard IEC60529. This water protection rating means that the sound processor with the Aqua+ can be continuously submerged under water to a depth of up to 3 meters (9 feet and 9 inches) for up to 2 hours. The Aqua+ accessory should be used when participating in prolonged water activities.
**The Cochlear Osia 2 Sound Processor is protected against water to level IP52 of the International Standard IEC60529 and IP57 with the battery compartment removed. The Cochlear Osia 2 Sound Processor with Aqua+ is dust and water resistant to the level of IP68 of the International Standard IEC60529 when used with LR44 alkaline or nickel metal hydride disposable batteries. This water protection rating means that the sound processor with the Aqua+ can be continuously submerged under water to a depth of up to 3 meters (9 feet and 9 inches) for up to 2 hours. Refer to the relevant User Guide for more information. In the United States and Canada, the Osia System is indicated for children ages five and older.

Cochlear®

The Journey to better hearing

© Cochlear Limited 2020

Your Journey To Better Hearing

1. **Hearing evaluation**
2. Implant procedure
3. Activation day
4. Get the most from your hearing implant

Implant Procedure

- Normally a routine outpatient procedure
- Typically performed under general anesthesia
- **Cochlear implants** - usually about two hours surgical time
  Bone conduction implants – about an hour
- Involves a small incision
- In a few days, most people are back to their normal activities
- Established treatment option for 40 years

Outcomes may vary.

Time Between Surgery and Activation

Nucleus 8 Sound Processor
Behind-the-ear Solution

Kanso 3 Sound Processor
Off-the-ear Solution

Nucleus Sound Processor with Hybrid Hearing*

Usually occurs within

*The Acoustic Component should only be used when behavioral audiometric thresholds can be obtained and the recipient can provide feedback regarding sound quality. The Hybrid L24 Implant is approved in the US for adults 18 and older (unilateral use only.) The Cochlear Nucleus Hybrid acoustic component is not compatible with the Kanso Sound Processor. The Kanso Sound Processor is not intended to be used by Hybrid L24 Cochlear Implant recipients who receive benefit from the acoustic component.
