Writing Goals

A clinician must consider a host of variables when establishing goals. Performance, condition, and criteria must be analyzed while taking into account baseline performance. SMART goals will lead to better performance in therapy. Review the readings and PowerPoint from this lecture as well as your notes.

You are challenged to create your own "quick reference" for writing goals. How will your client respond? Time frame? Cuing? These are just a few behaviors to consider. This reference should include global goal considerations as well as behaviors specific to AR.

- Imitative vs. spontaneous
- Immediate vs. delayed response
- Verbal vs. nonverbal response
- Percentage vs. # of trials
- 2 vs. 3 consecutive sessions
- Cuing vs. no cuing
- Type of cuing (auditory/visual/tactile/orthographic)
- Level of cuing (min/mod/max)
- Background noise vs. quiet
- 10 (?) minute activity vs. length of session
- Sign use vs. no sign
- Familiar vs. unfamiliar communication partner
- Familiar vs. unfamiliar setting
